## Binary packages built by this source

### [docker.io](#): Linux container runtime

Docker complements kernel namespacing with a high-level API which operates at the process level. It runs unix processes with strong guarantees of isolation and repeatability across servers.

### [golang-docker-dev](#): Transitional package for golang-github-docker-docker-dev

This is a transitional package to ease upgrades to the golang-github-docker-docker-dev package. It can safely be removed.

### [golang-github-docker-docker-dev](#): Externally reusable

Docker is a great building block for automating distributed systems:  
large-scale web deployments, database clusters, continuous deployment systems,  
private PaaS, service-oriented architectures, etc.

·  
This package contains the daemon and client. Using docker.io on non-amd64 hosts  
is not supported at this time. Please be careful when using it on anything  
besides amd64.

·  
Also, note that kernel version 3.8 or above is required for proper operation of  
the daemon process, and that any lower versions may have subtle and/or glaring  
issues.

### Go packages included with Docker

These packages are intentionally developed by upstream in such a way that they  
are reusable to projects outside Docker and only rely on each other or other  
external dependencies to be built.

### **vim-syntax-docker:** Docker container engine - Vim highlighting syntax files

This package provides syntax files for the Vim editor for editing Dockerfiles  
from the Docker container engine.
